

AN IMPROVEMENT ON A GRINDING TOOL

ABSTRACT

5 A grinding tool includes a toothed grinding wheel, two opposing
stationary grinding members, and an actuating wheel; the grinding
wheel is connected to a transmission shaft turnably connected to a
housing and having an engaging end projecting from the housing; the
stationary grinding members are fixedly disposed in the housing, and
10 have grinding teeth on inward surfaces facing the grinding wheel; the
actuating wheel is connected to the engaging end of the shaft at a
middle connecting hole so that rotation of the actuating wheel can be
passed on to the grinding wheel by means of the shaft; thus, contents
of the housing can be ground with the grinding wheel and the
15 stationary grinding members by means of holding the housing still,
and turning the actuating wheel to and fro repeatedly.
